

Towards Binary Diversification

Christopher Stricklan, Robert Heine, and Dr. TJ O'Connor

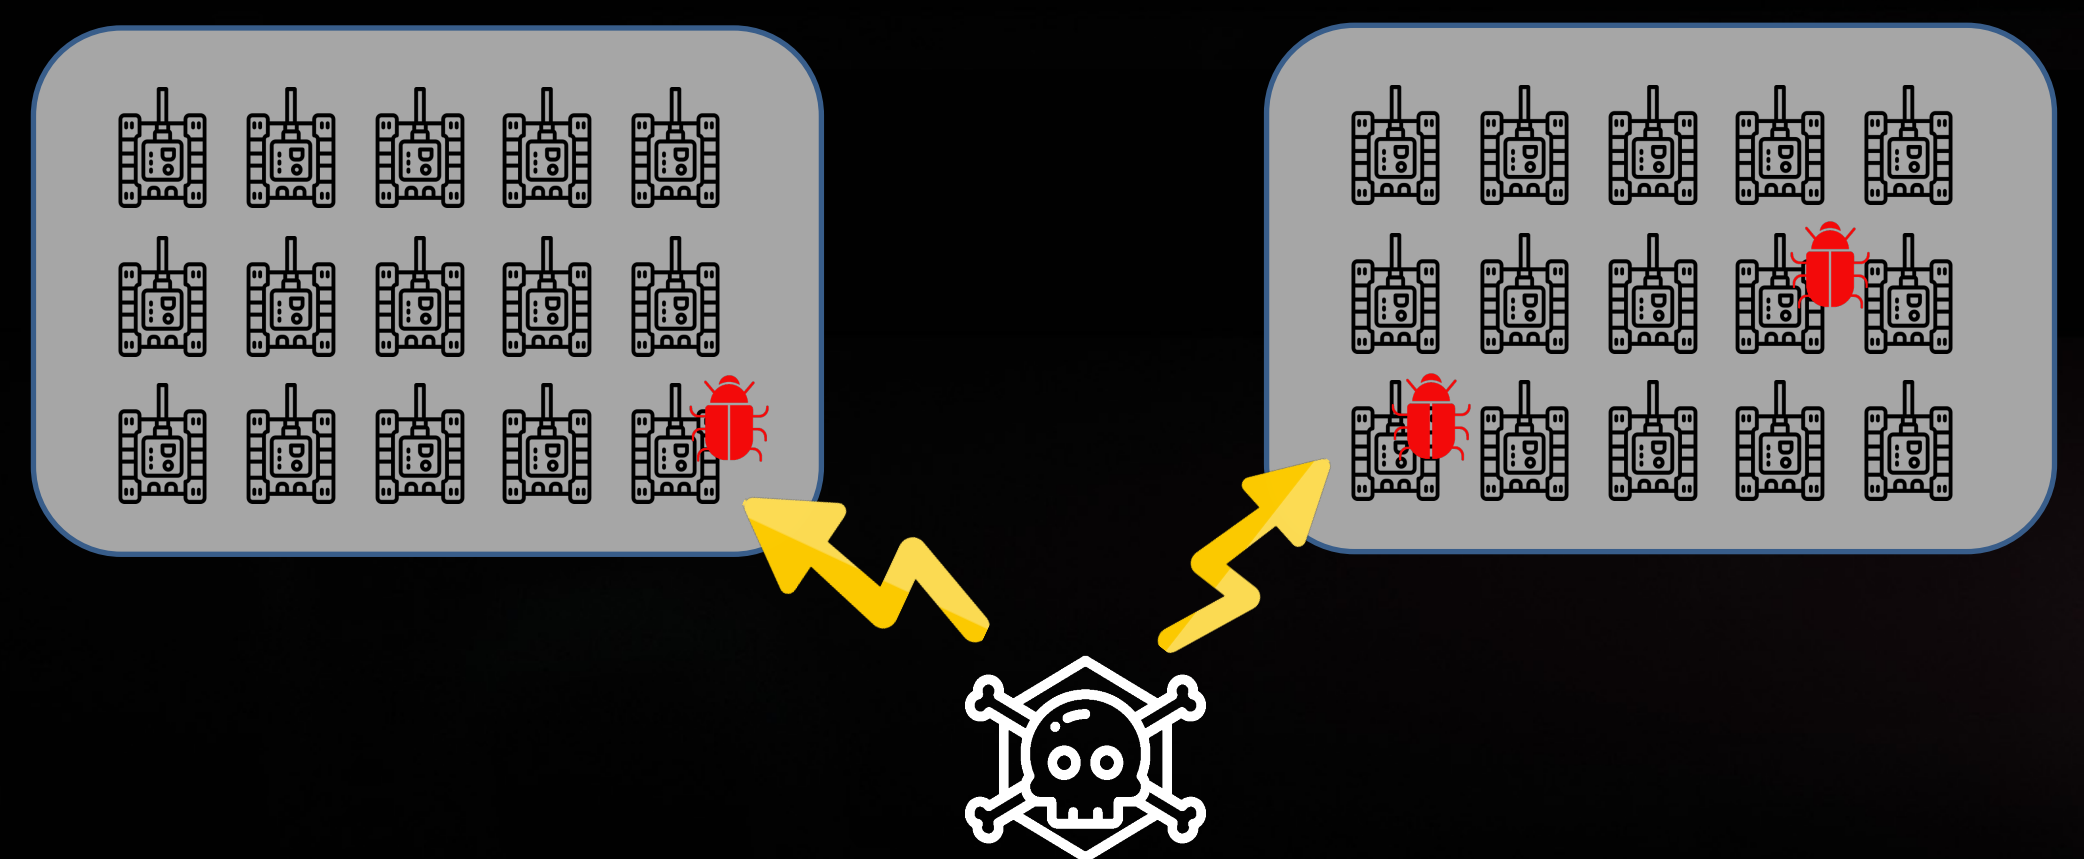

Problem Statement:

All software programs released to consumers, corporations, and governments targeting desktop, mobile, or embedded systems will have a monolithic binary structure. Specifically, Building Diverse Computer Systems [1] discusses software monoculture being the reason why computers are vulnerable to large scale and repeated attacks. This monolithic binary culture leaves systems open to software exploitation across any number of computer systems in many environments.

Today's Environment

Tomorrow's Environment

Research Questions:

RQ1: Can a generalized tool to generate binary variants be developed to provide passive protections to computer systems?

RQ2: How do we measure binary diversification?

RQ3: Can we measure the efficacy of binary diversification's ability to make an appreciable difference in preventing binary exploitation?

Research Plan:

Generate binary variants

- Build Tooling with LLVM/Clang compiler

Measure binary diversification

Measure the efficacy of binary diversification

- Build Tools to measure researcher's process
- Use The Space Heroes CTF

Epilogue Binary Transform

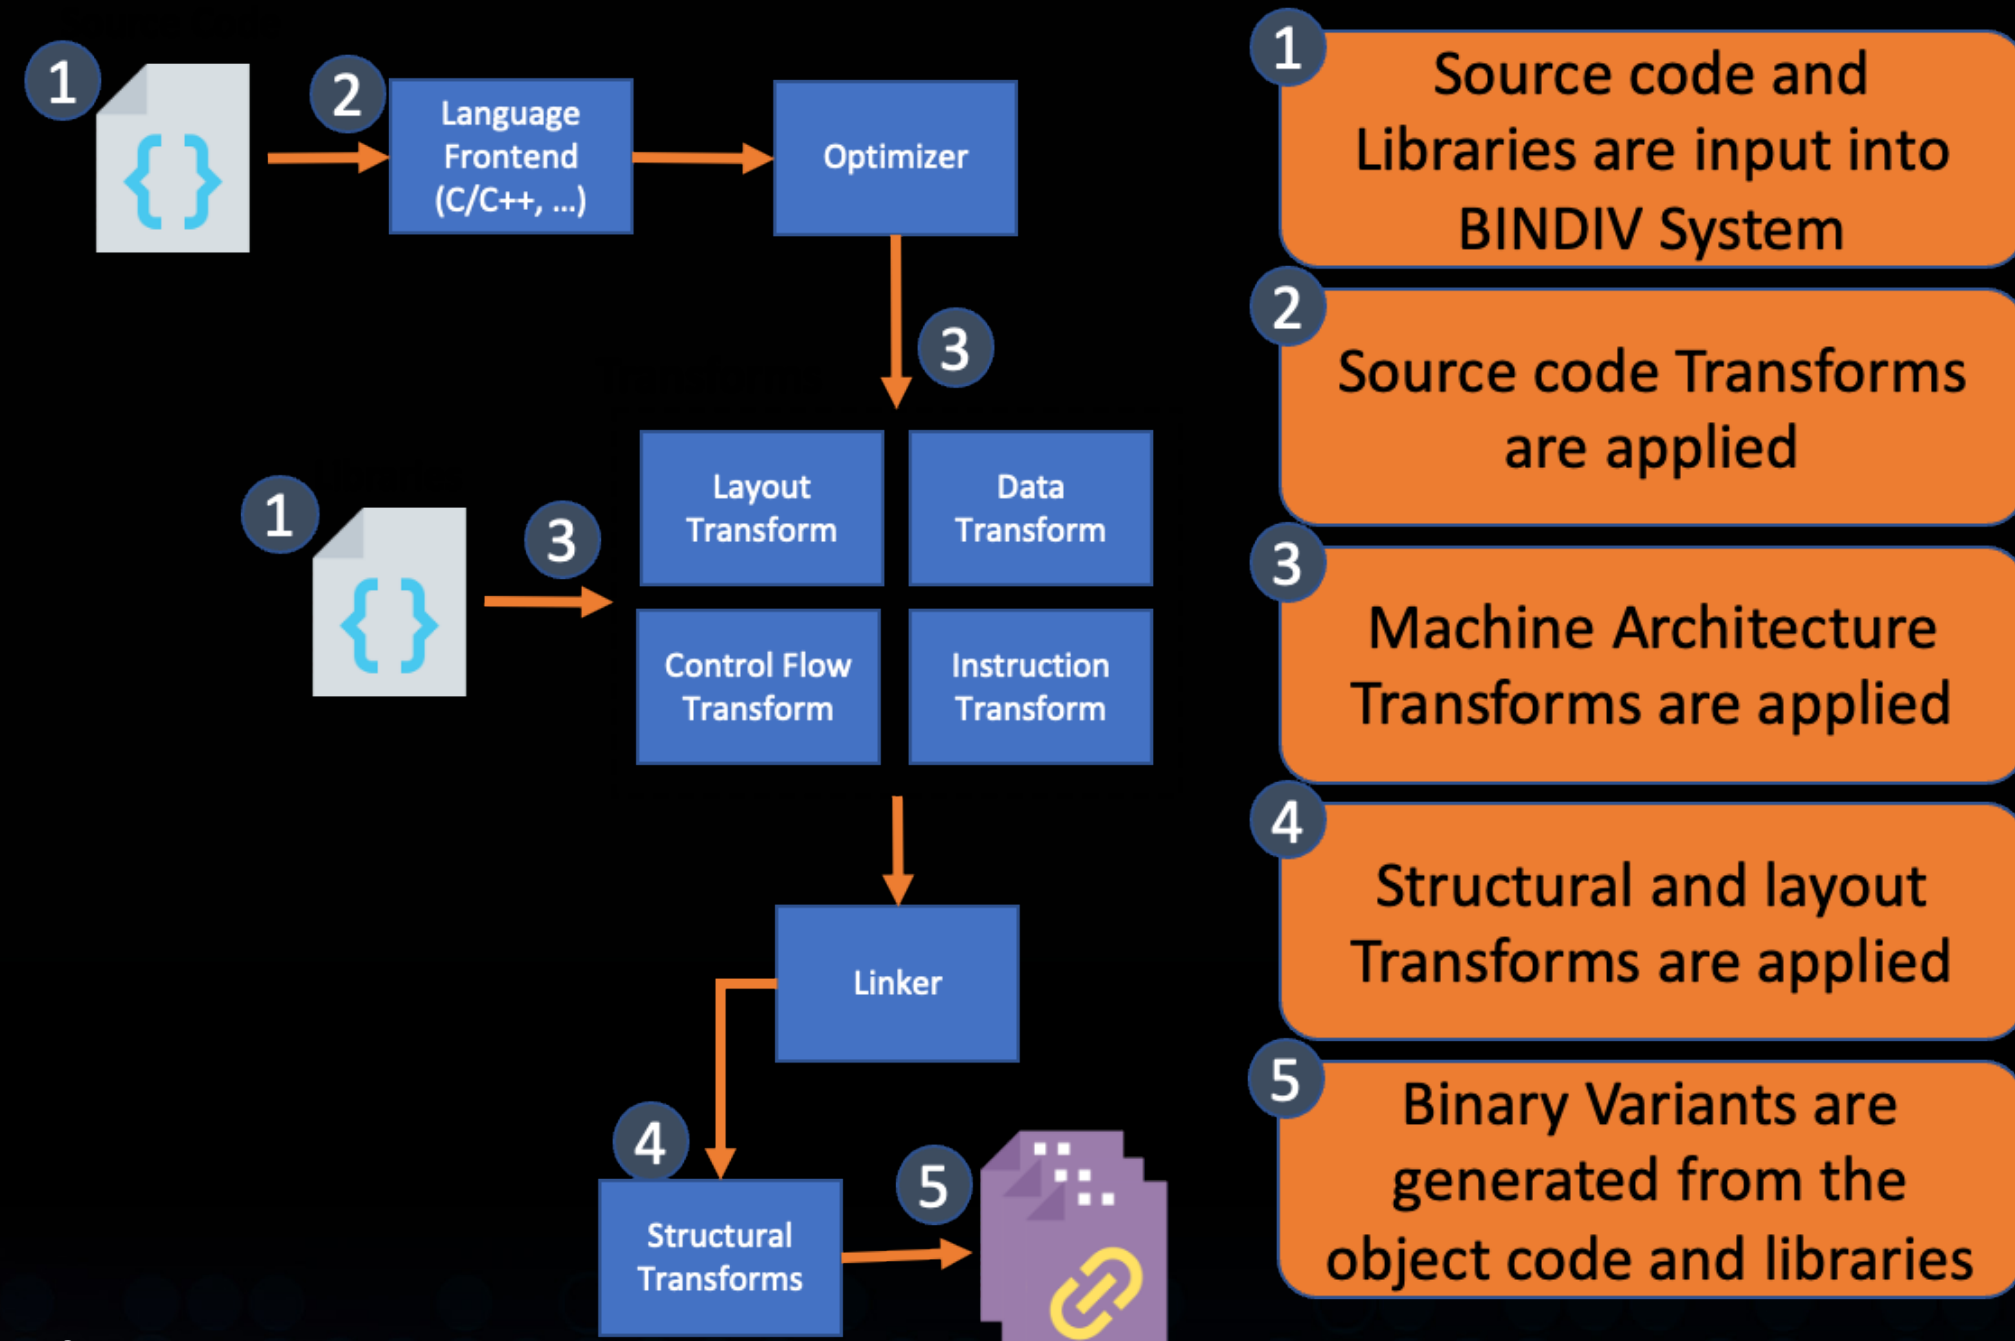

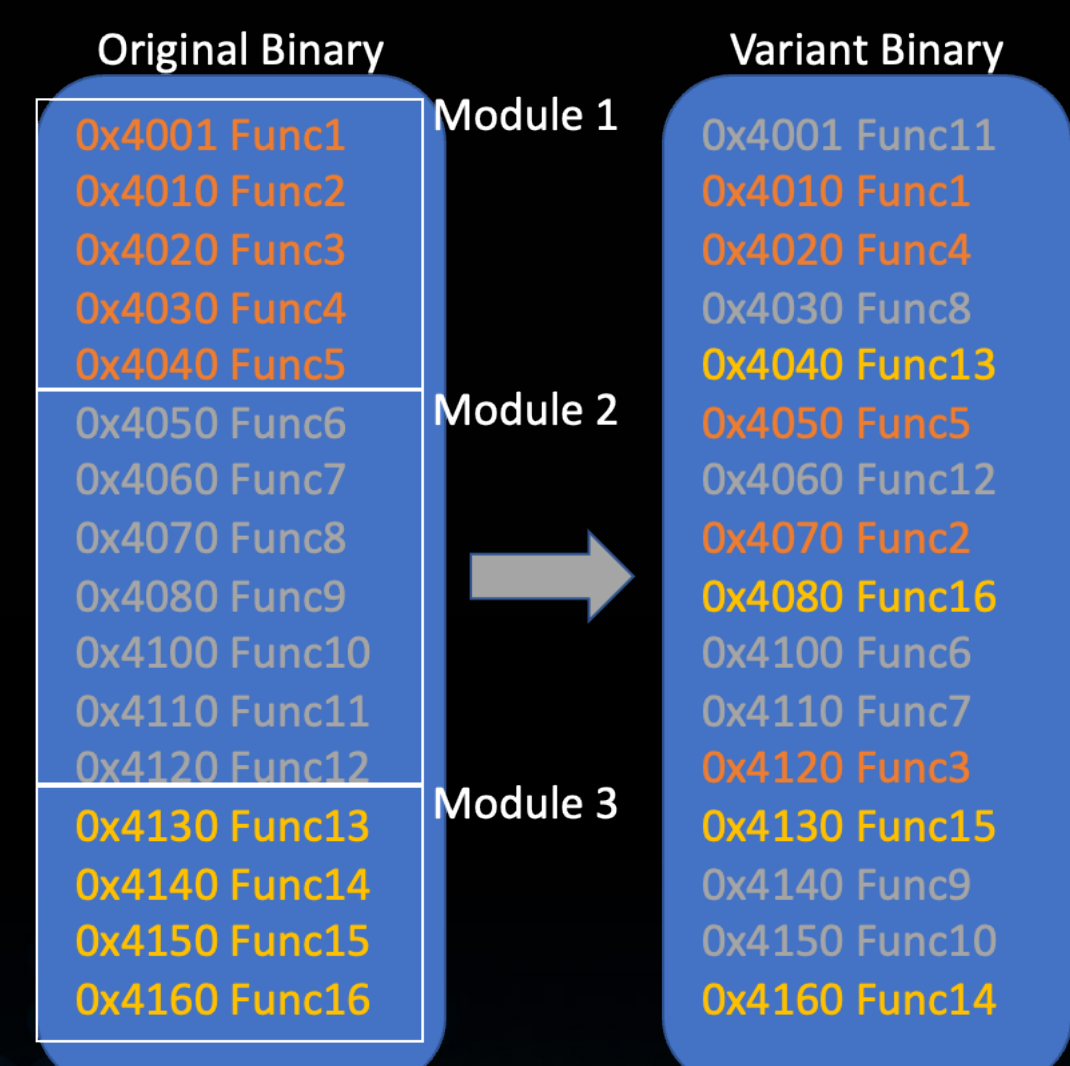

```
mov edi, 0x4009e7 {"\nExiting"}
call puts
mov eax, 0x0
pop rbp {__saved_rbp}
ret {__return_addr}
```

```
mov edi, 0x4009e7 {"\nExiting"}
call puts
mov ebx, 0x0
pop rbp {__saved_rbp}
ret {__return_addr}
```

```
mov edi, 0x4009e7 {"\nExiting"}
call puts
mov ecx, 0x0
pop rbp {__saved_rbp}
ret {__return_addr}
```

```
mov edi, 0x4009e7 {"\nExiting"}
call puts
mov edx, 0x0
xor eax, eax {0x0}
pop rbp {__saved_rbp}
ret {__return_addr}
```

Structural Transform
