

The Guardol Language and Verification System

Hardin, Slind, Whalen, and Pham

Guardol Concept

A *guard* mediates information sharing between security domains according to a specified policy

Goal: Generalize the experience
Make the process of specifying and implementing high assurance guards more efficient, flexible, repeatable...

2005 - High Assurance Guard demo

2007 - Turnstile

2010 - MicroTurnstile

4/20/2012 Guardol Language and Verification System 2

Guardol Objectives

- Develop **Domain Specific Language** for guards
 - Specification language dedicated to a particular problem domain, representation style, solution technique
- Automate the design flow
 - Analysis and implementation artifacts automatically generated with high assurance
- Integrated analysis capabilities
 - Model checking of key requirements from guard specification
 - Information flow analysis to verify correct data paths and separation
- Support for a wide variety of guard platforms
 - Configurable guards
 - Custom hardware, embedded software
 - Open/standard platforms

4/20/2012 Guardol Language and Verification System 3

Typical Guard Operations

- packet observations – reading field values of the packet
- packet dropping – removal of an entire packet from the stream
- packet transformation – changing the value of fields in a packet
- packet expansion – adding new fields to a packet
- packet contraction – removing fields from a packet
- packet generation – construction of audit messages

4/20/2012 Guardol Language and Verification System 4

Example: Dirty Word Search

```
type Msg = string;
type Result = { Ok: Msg | Audit: string };
imported function DIRTY_WORD_SEARCH(Text : in Msg, Output : out Result);
```

Examples

```
DIRTY_WORD_SEARCH("This is CLASSIFIED data", Output);
Output: Ok => "This is ----- data"
```

```
DIRTY_WORD_SEARCH("This is SECRET data", Output);
Output: Audit => "Secret data detected. Message deleted."
```

4/20/2012 Guardol Language and Verification System 5

Dirty Word Search on Trees

```
type MsgTree = { Leaf | Node: [Value: Msg; Left: MsgTree; Right: MsgTree] };
type ResultTree = { Ok: MsgTree | Audit: string };

function DWS_TREE(Input : in MsgTree, Output : out ResultTree) = begin
var
ValueResult : Result;
LeftResult, RightResult : ResultTree;
in
match Input with begin
MsgTree'Leaf => Output := ResultTree'Ok(MsgTree'Leaf);
MsgTree'Node node => begin
DIRTY_WORD_SEARCH(node.Value, ValueResult);
match ValueResult with begin
Result'Audit A => Output := ResultTree'Audit(A);
Result'Ok ValueMsg => begin
...
Output := ResultTree'Ok(MsgTree'Node
[ Value: ValueMsg, Left: LeftMsgTree, Right: RightMsgTree ]);
end
end
end
end
end
end
```

Guardol = Ada + ML-Style Datatypes

Desirable property: if message is emitted, then it contains no dirty words

4/20/2012 Guardol Language and Verification System 6

Property Specification

```
spec DWS_TREE_Correct = begin
var
MT : MsgTree;
RT : ResultTree;
in
if (forall (M:Msg).DWS_Idempotent(M))
then begin
DWS_TREE(MT, RT);
match RT with begin
ResultTree'Ok MT2 =>
check DWS_TREE_Correct(MT2);
ResultTree'Audit A => skip;
end
end
Output := Output and
DWS_TREE_Correct(node.Left) and
DWS_TREE_Correct(node.Right);
end
end
end
```

function DWS_TREE_Check(MT : in MsgTree) returns Output : bool = begin
var
R : Result;
in
match MT with begin
MsgTree'Leaf => Output:=true ;
MsgTree'Node node => begin
DIRTY_WORD_SEARCH(node.Value, R);
match R with begin
Result'Ok M =>
Output:=(node.Value = M);
Result'Audit A =>
Output:=false;
end
end
Output := Output and
DWS_TREE_Check(node.Left) and
DWS_TREE_Check(node.Right);
end
end
end

Guardol Analysis Architecture

Guardol Source → Guardol S-expression → Gryphon Suite → Ada Code

Operational Semantics, Functional Decomplier, VC Gen → HOL → Generated VCs → Sdk2 tool (using cvc4 or z3) → Counterexample

Datatype Decision Procedure

4/20/2012 Guardol Language and Verification System 8

Guardol Analysis Architecture

```
Hol_datatype
result = ACCEPT of tree |
AUDIT of string;

val dwGuard_def =
tDefine "dwGuard"
(dwGuard Leaf = ACCEPT Leaf) /\
case ext.dwCheck N.elem
of BAD s -> AUDIT s
|| OK s ->
case dwGuard N.left
of AUDIT s -> AUDIT s
|| ACCEPT t1 ->
case dwGuard N.right
of AUDIT s -> AUDIT s
|| ACCEPT t2 ->
ACCEPT (Node (N with
<| left := t1;
elem := s;
right := t2 |>)))`
```

Counterexample

4/20/2012 Guardol Language and Verification System 9

Verification Conditions

Quantifier-free Formula

```
(assert
(and (= (dwGuardfn tree') (ACCEPT t))
(and (checkTreefn t)
(and (= (dwGuardfn tree) (ACCEPT t'))
(and (checkTreefn t')
(not (checkTreefn (Node t' s' t))))))
...
where
(define-fun checkTreefn ((MT MsgTree)) bool
(ite (is_MsgTree_Leaf MT)
true
(and
(let ((R (DIRTY_WORD_SEARCH (MsgTree_value MT))))
(and (is_Result_Ok R)
(= (Result_Value R) M)))
(checkTreefn (MsgTree_left MT))
(checkTreefn (MsgTree_right MT))))))
```

Collection Domain with a Decidable Theory

Generalized Fold Function

4/20/2012 Guardol Language and Verification System 10

Suter-Dotta-Kuncak Procedure

- Purification

```
(and (= (dwGuardfn tree) (ACCEPT t'))
(and (checkTreefn t')
(not (checkTreefn (Node t' s' t)))) ...
(= t1 (Node t' s' t)) (= t2 (ACCEPT t'))
(= c1 (checkTreefn t')) (= c2 (checkTreefn t1))
(= (dwGuardfn tree) t2) c1 (not c2))
```
- Unification & Partial Evaluation
 - Structural unification of tree terms
 - ...followed by partial evaluation of catamorphism (fold) function over unified trees
- Afterwards: formula in *collections theory*
- Important quality: **completeness**

4/20/2012 Guardol Language and Verification System 12

So, what can we prove?

- Properties of message fields:
 - Field z is always > 0
 - Field z contains less than 50 characters
 - Field z has no dirty words
 - Field z has precision no better than 10 meters
 - Applying f to z leaves z unchanged
- Properties of abstractions of message fields:
 - The sum of all integer fields is < 100.
 - The number of dirty words is < 10.
 - The set of all fields in the message contains y.
- Relations of abstractions between abstractions of pre- and post-messages.
 - If x contained no dirty words prior to processing, then it contains no dirty words after processing.

4/20/2012 Guardol Language and Verification System 17

Conclusion

- Guardol: New DSL and tool suite for reasoning about guards
 - Has nice guarantees for certain kinds of properties
 - Language syntax is reasonable to non-geeks
 - Tools and architecture designed for rigor from specification through to implementation
- Decision procedures [SDK] are now able to prove interesting properties of unbound data & computation
 - We have an open-source tool available [UMN].
- Lots of interesting future work involving
 - Language improvements
 - Integration of string decision procedures
 - Extending SDK completeness results
 - Support for intentional properties
