

Symposium On The Science Of Security (HoTSoS 2024)

Presenter: Muneeba Asif

Analytics for Cyber Defense (ACyD) Lab

Florida International University

Miami, FL, USA

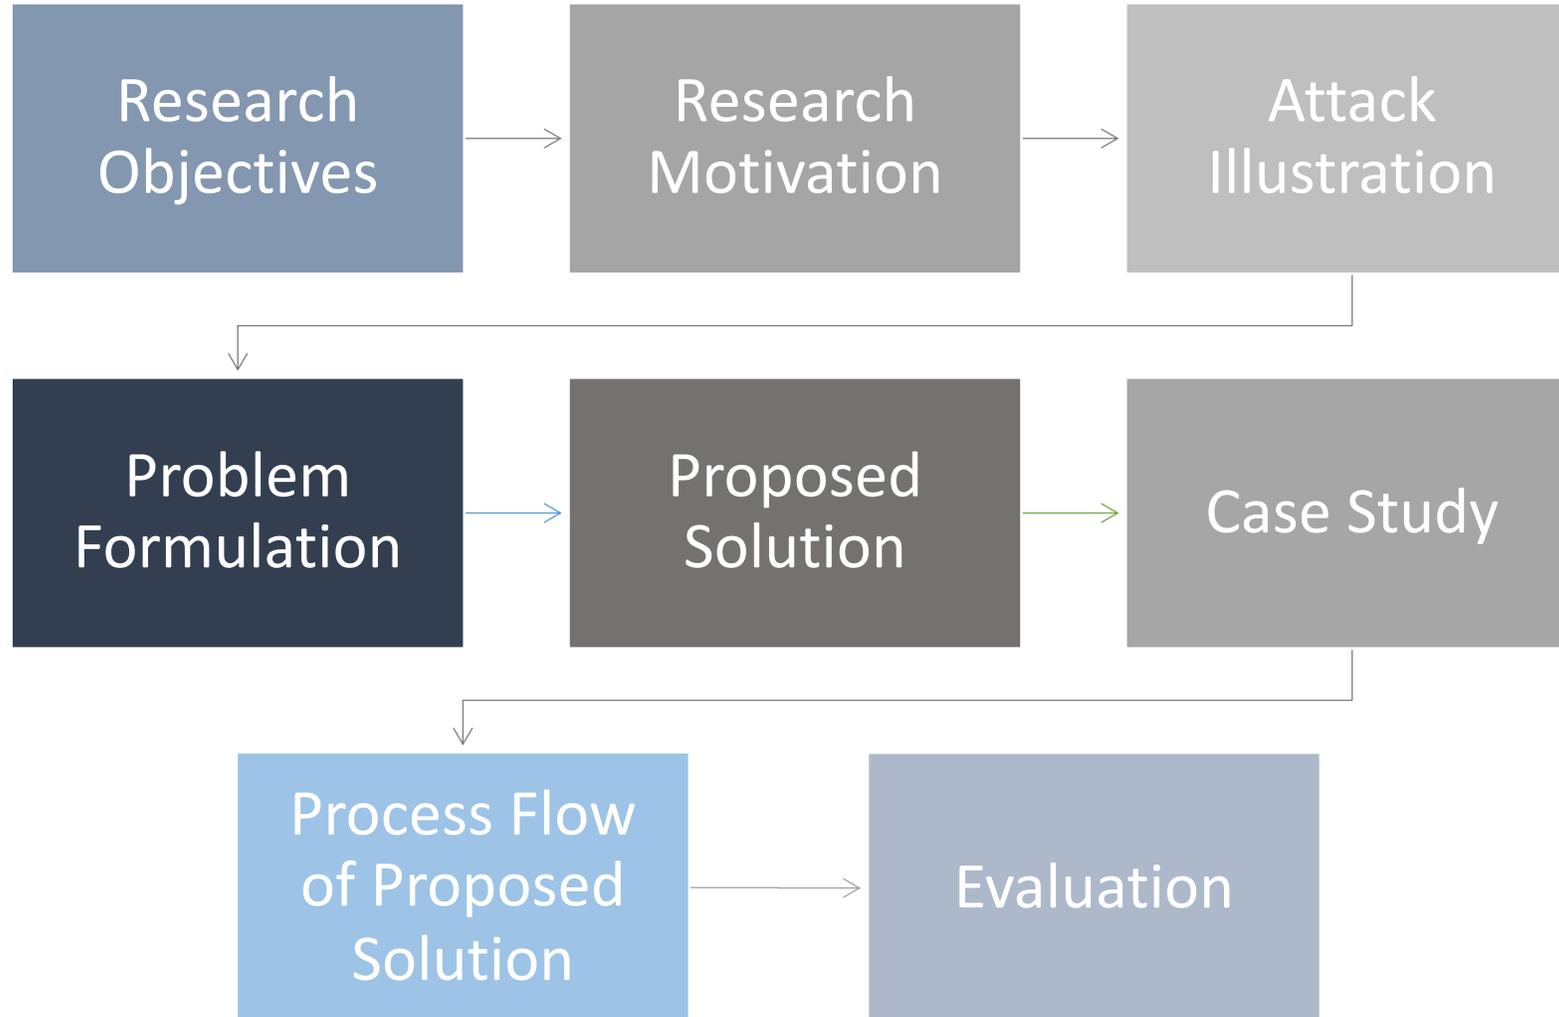

Adversarial Data-Augmented Resilient Intrusion Detection System for Unmanned Aerial Vehicles

➤ **Published:** IEEE Big Data 2023 – Privacy and Security of Big Data (PSBD)

➤ **Authors:**

- Muneeba Asif (ACyD Lab, Florida International University (FIU))
- Mohammad Ashiqur Rahman (ACyD Lab, FIU)
- Kemal Akkaya (ADWISE Lab, FIU)
- Hossain Shahriar (Center for Cybersecurity, University of West Florida)
- Alfredo Cuzzocrea (iDEA Lab, University of Calabria)

Presentation Outline

UAVs and Their Applications

- Unmanned Aerial Vehicles (UAVs), aka drones, have multidisciplinary applications.
- Big tech companies are including and utilizing the many advantages UAVs bring with them.

Disaster Management

Electric Power Grid Inspections

Precision Agriculture

Defense and Military

Research Objectives and Statistics

- Introduction
 - Research objectives

- Proposed Solution
- Case Study
- Methodology
- Evaluation
- Conclusion

RO-1: Comprehensive Security Analysis of UAV Systems in the Face of Adversarial Machine Learning Threats

❖ Conducting a thorough analysis and evaluation of UAV systems, focusing specifically on their robustness in security when confronted with sophisticated adversarial machine learning threats.

RO-2: Enhancing UAV IDSs' Resilience in Response to Adversarial Samples:

❖ Developing and implementing strategies to significantly enhance the resilience of IDSs for UAVs, explicitly identifying and mitigating the impact of meticulously crafted adversarial samples.

UAV industry projected to be \$91.23 billion by 2030

1

Attacks can have severe consequences: mission thwarting, UAV intercepting/hijacking, etc.

2

Owing to the nature of its applications, security, and mission precision are vital for UAVs

3

[Google reCAPTCHA Cracked in New Automated Attack](https://news.softpedia.com/news/google-recaptcha-cracked-in-new-automated-attack-502677.shtml)

A trio of security researchers have devised a new automated attack that can break the CAPTCHA systems employed by Google and Facebook.

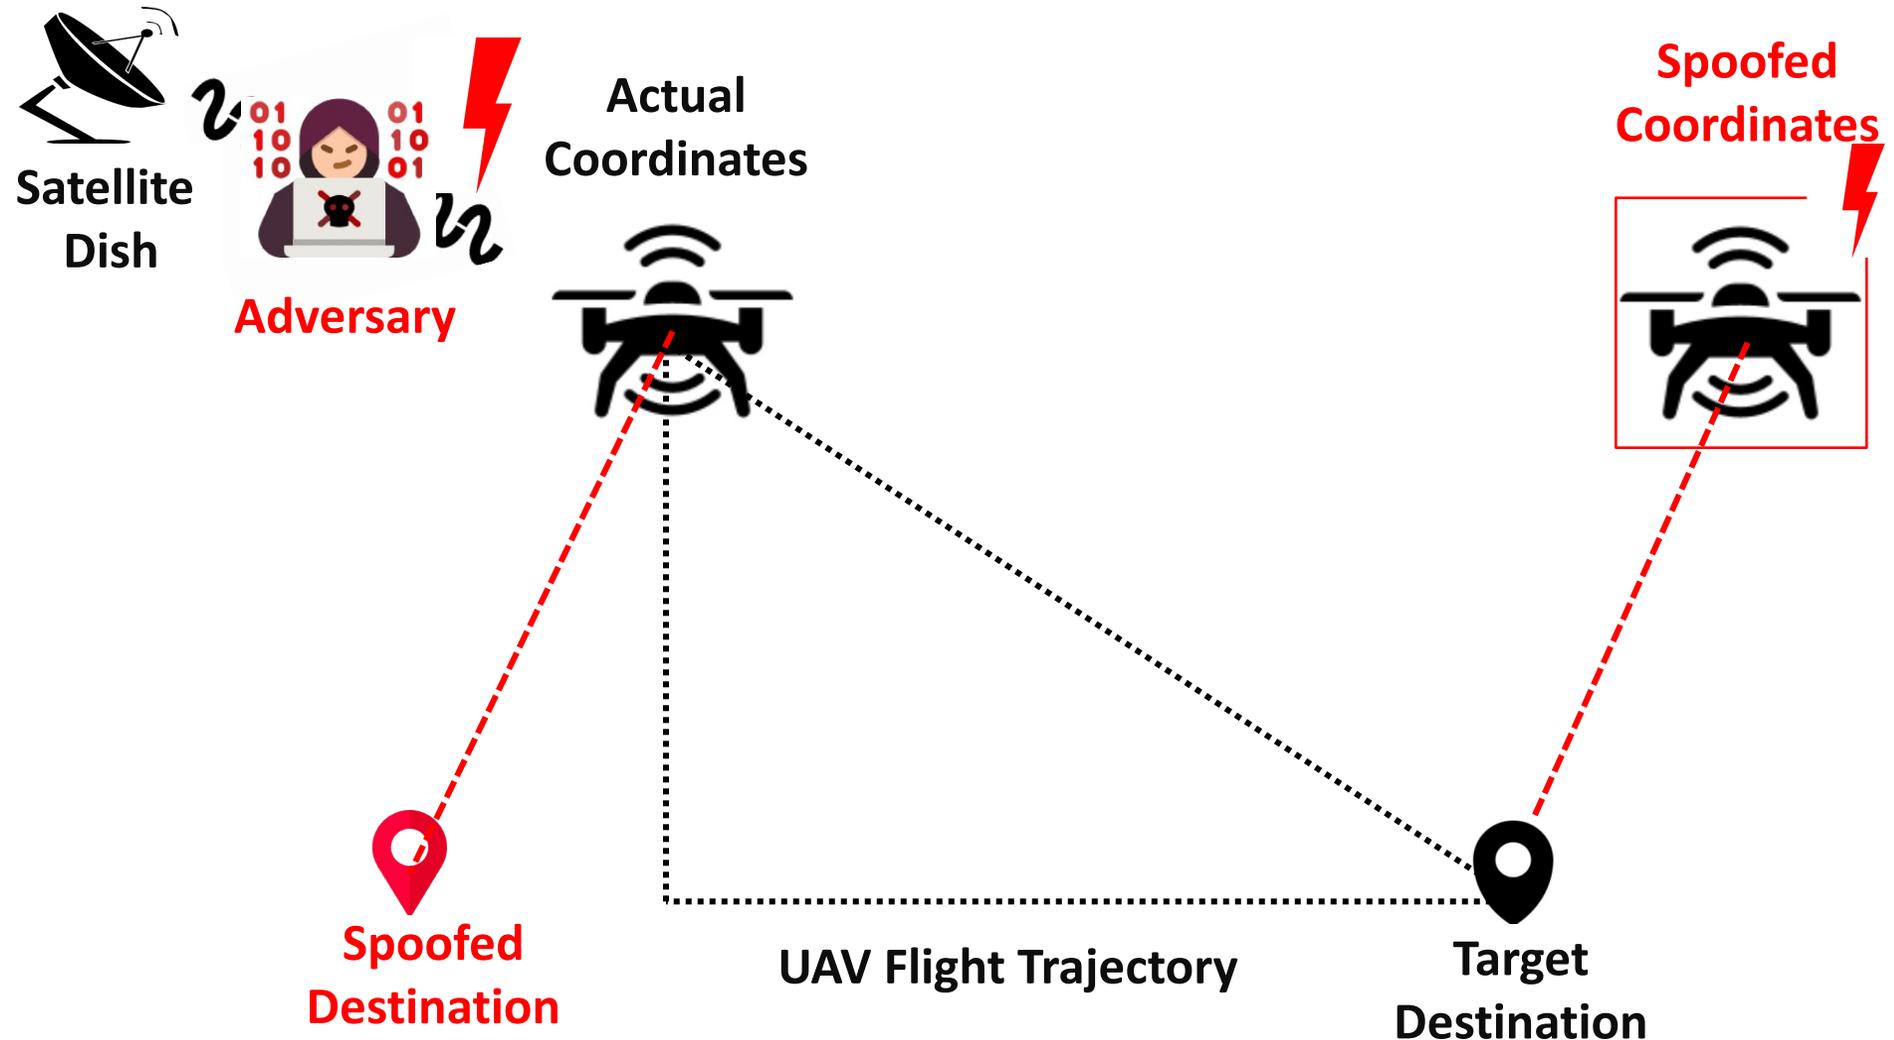

Researchers modified the audio CAPTCHAs slightly to mislead the speech-to-text API used for verification, achieving a high success rate in breaking the CAPTCHA.

Some Real-Life Attack Instances

- Conclusion

So, what is the existing detection mechanism for this?

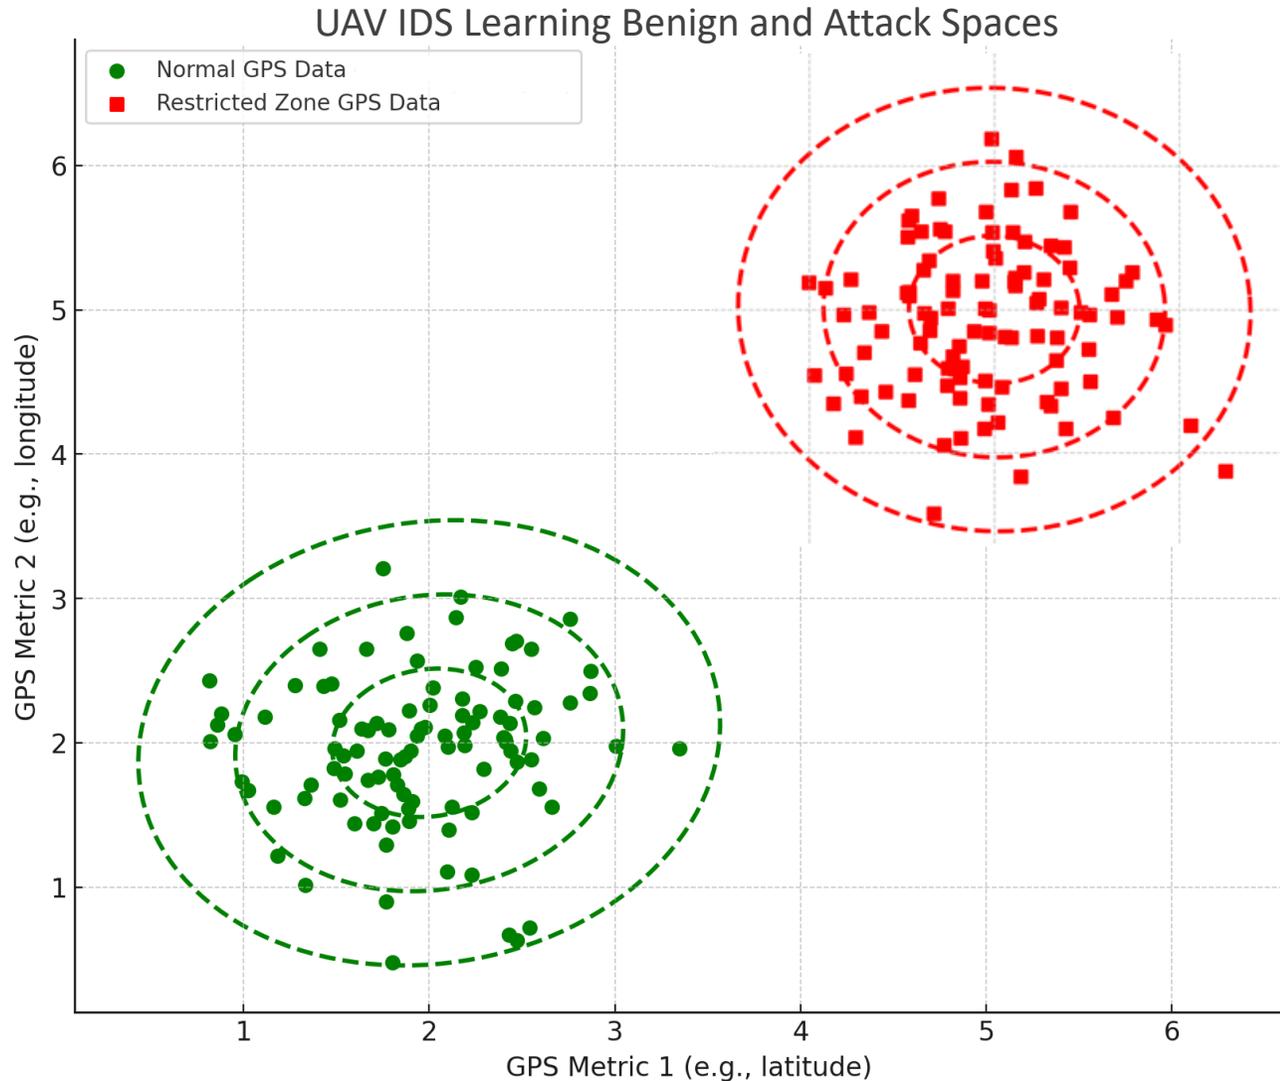

GPS spoofing attack simulated using jMAVsim

And what is the research gap, this paper seeks to address?

Problem Formulation (1/3)

- Introduction
- Attack Illustration
- **Problem Formulation**
- Proposed Solution
- Case Study
- Methodology
- Evaluation
- Conclusion

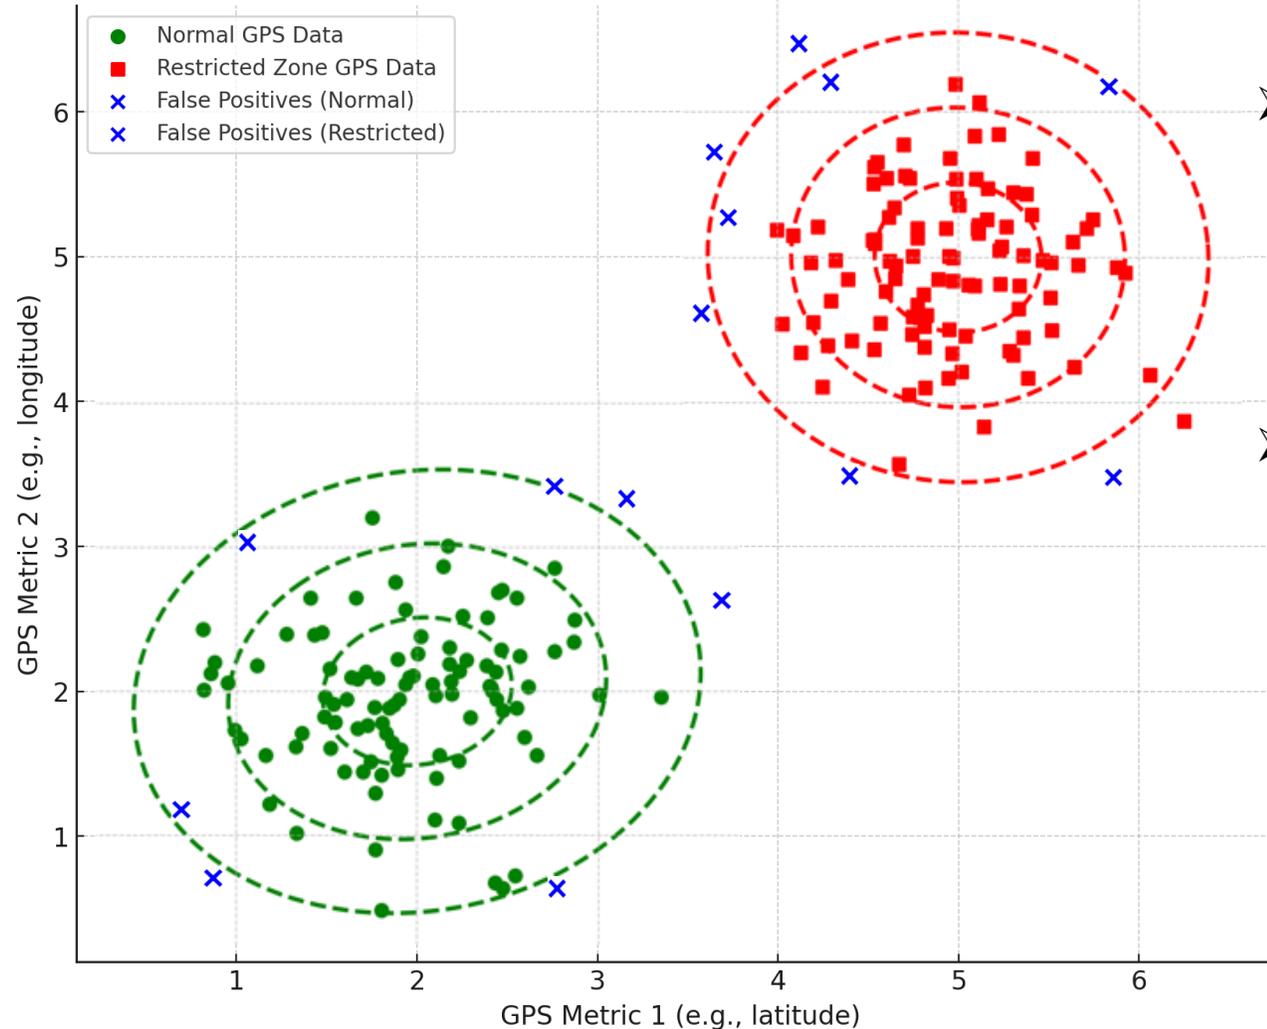

- Comprehensive UAV data collection is challenging
 - extensive flight time
 - operational coverage
 - variable environmental conditions
 - ❖ expensive
 - ❖ time consuming
- Collected data
 - sparse and limited
 - ❖ benign
 - ❖ malicious

Problem Formulation (2/3)

- Introduction
- Attack Illustration
- Problem Formulation**
- Proposed Solution
- Case Study
- Methodology
- Evaluation
- Conclusion

Illustration of False Positives with Cluster Boundaries

➤ IDS misclassifies data points

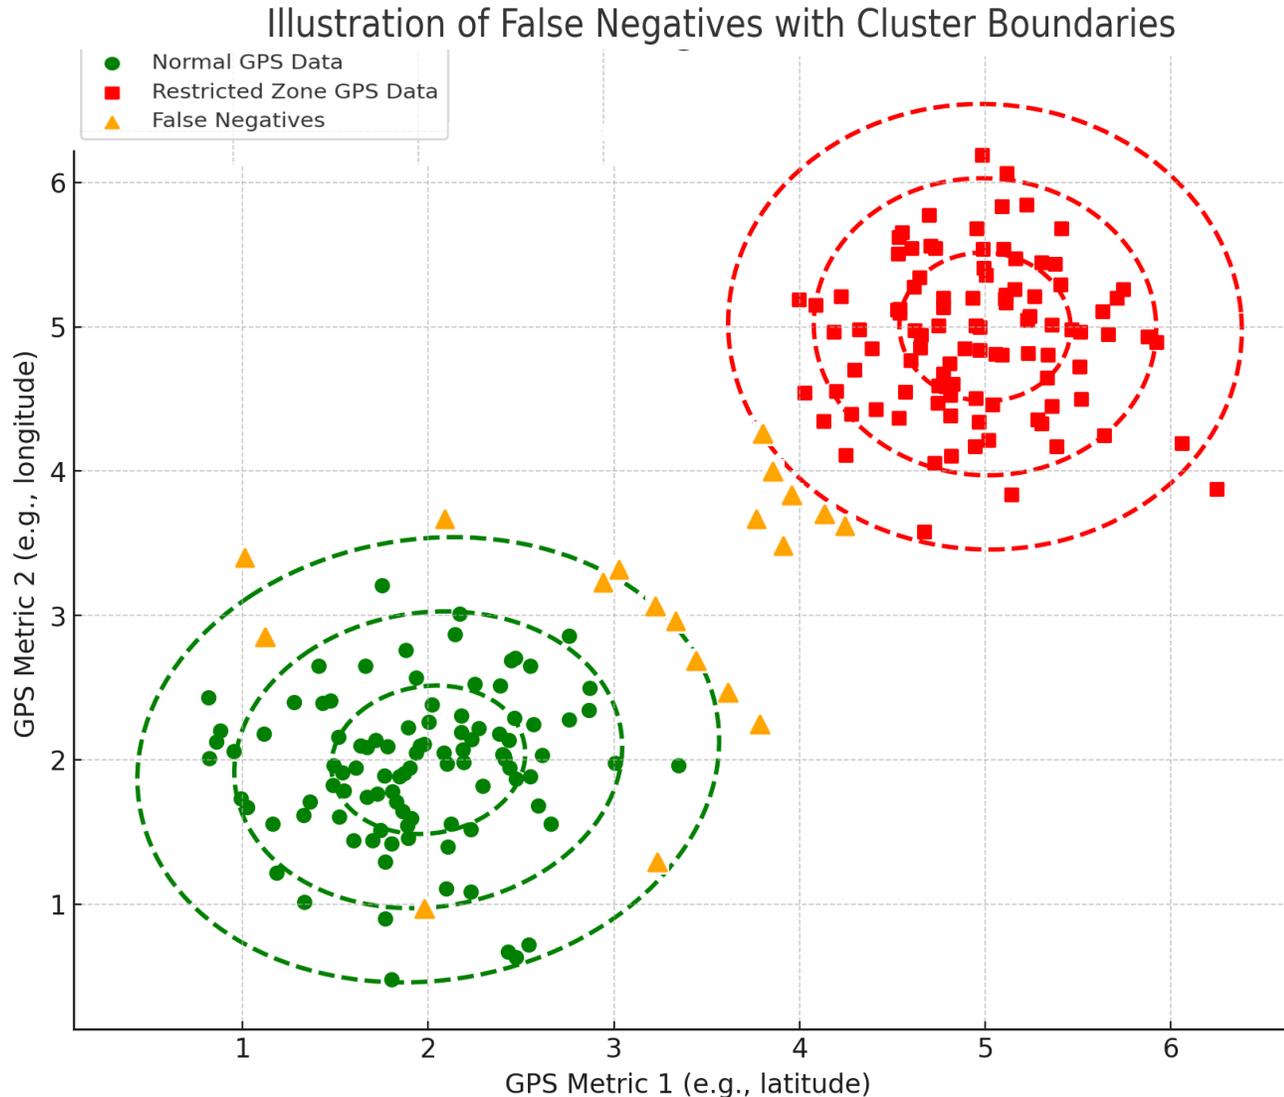

- ❑ false positive
 - ❖ a benign GPS coordinate identified as an attacked sample

➤ Reason

- ❑ less accurate boundaries due to data sparsity
 - ❖ false positive data points lie closer to or outside the boundaries

Problem Formulation (3/3)

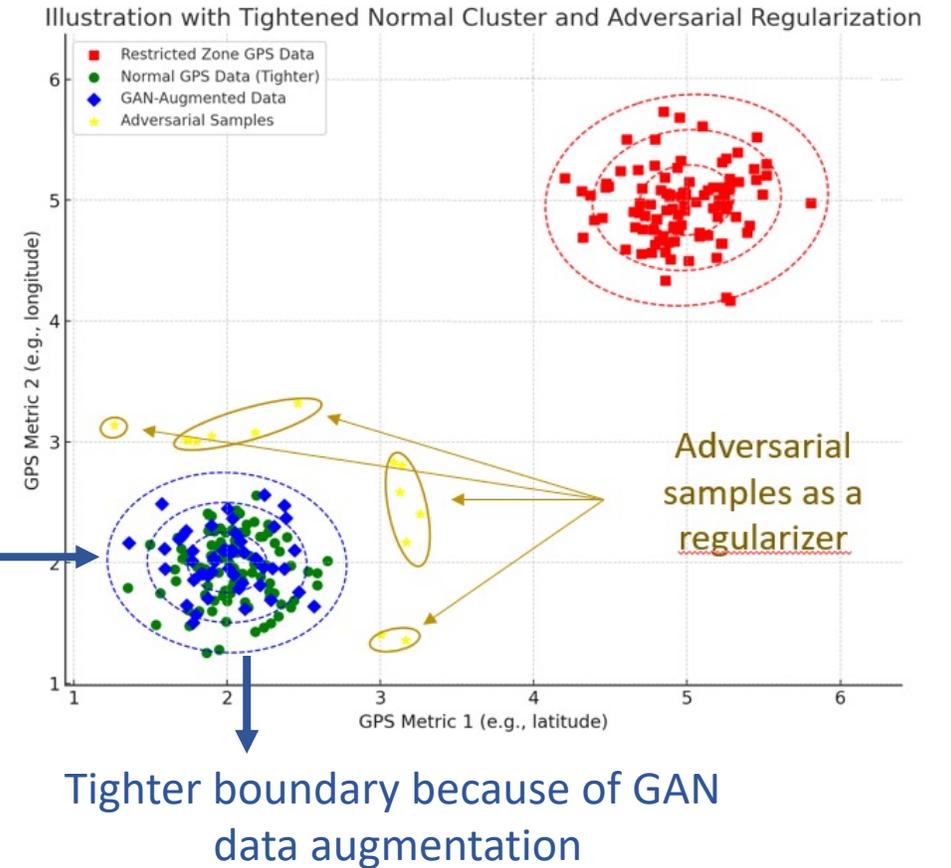

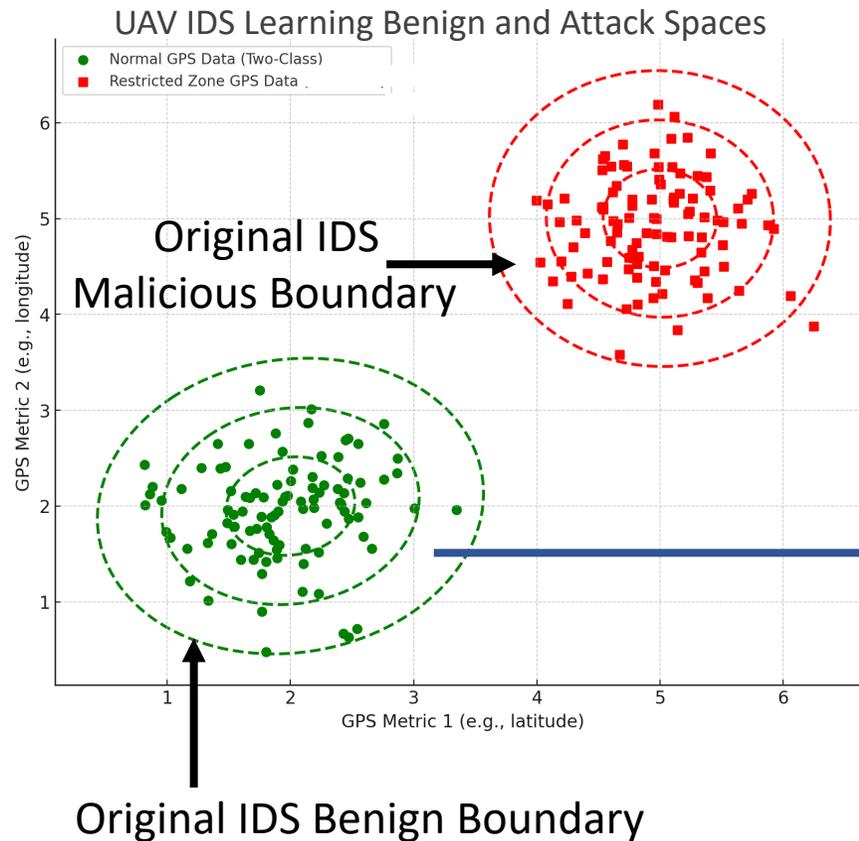

- Introduction
- Attack Illustration
- **Problem Formulation**
- Proposed Solution
- Case Study
- Methodology
- Evaluation
- Conclusion

- IDS misclassifies data points
 - false negative
 - ❖ a malicious GPS coordinate identified as a benign sample
- Reason
 - less accurate boundaries due to data sparsity
 - ❖ false negative data points lie closer to or outside the boundaries
- Adversarial exploitation
 - craft benign-looking adversarial samples
 - ❖ evade existing IDSs

Proposed Solution for Enhanced Resilience

- Conclusion

Case Study (Crafting Samples)

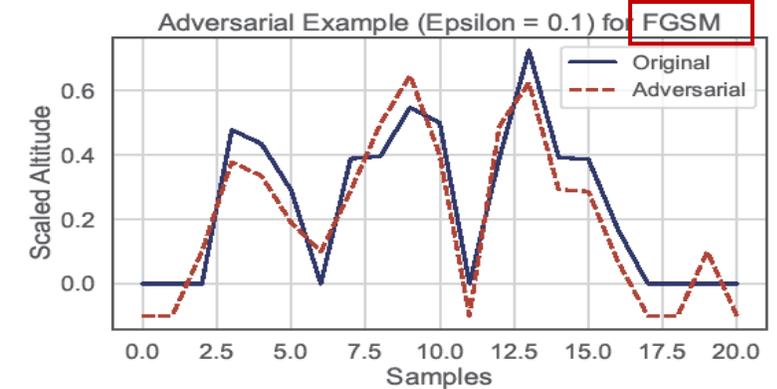

- Introduction
- Attack Illustration
- Problem Formulation
- Proposed Solution
- Case Study -- Crafting Samples -- Impact
- Methodology
- Evaluation
- Conclusion

- Adversarial attacks subtly alter GPS signals, causing IDS to misidentify benign signals as threats or miss actual threats, risking UAV security.
- Perturbations (δ_{GPS}) are optimized to craft signals without exceeding the defined threshold (ϵ_{GPS}), maintaining stealth and causing misclassification.

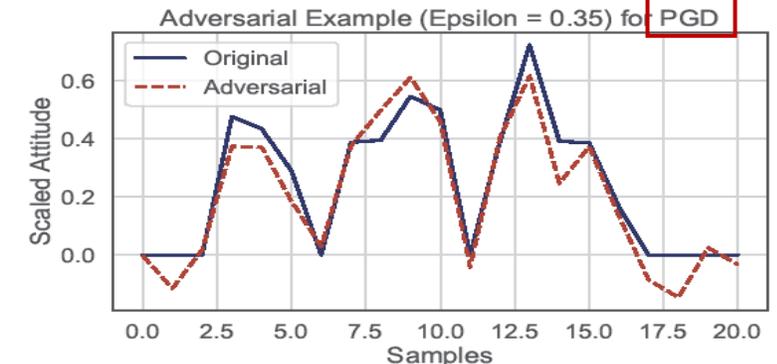

$$\min_{\delta_{GPS}} \|\delta_{GPS}\| \text{ subject to: } IDS(GPS_{orig} + \delta_{GPS}) \neq IDS(GPS_{orig})$$

Constraint: $\|\delta_{GPS}\| \leq \epsilon_{GPS}$

- The constraint $\|\delta_{GPS}\| \leq \epsilon_{GPS}$ makes the adversarial perturbation go undetected by the IDS.

$$x_{adv} = x + \epsilon \cdot \text{sign}(\nabla_x J(x, y_{true}))$$

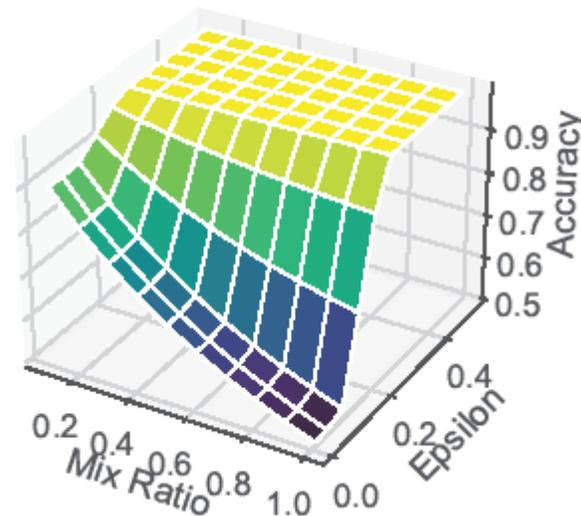

Projected Gradient Descent (PGD) refines perturbations iteratively within the allowed range for a stronger adversarial example.

Impact of Adversarial Samples

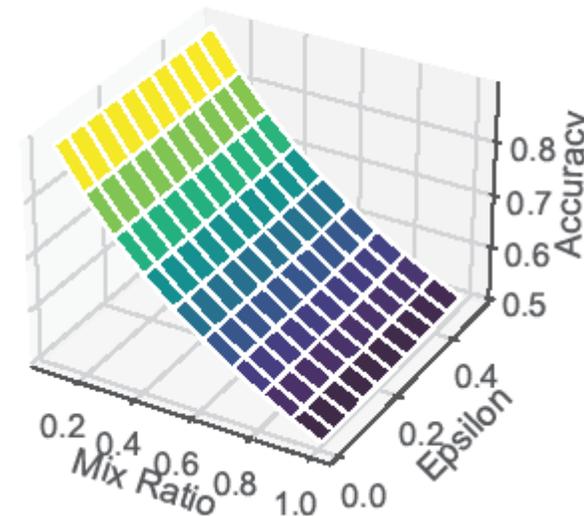

- Introduction
- Attack Illustration
- Problem Formulation
- Proposed Solution
- Case Study**
 - Crafting Samples
 - Impact
- Methodology
- Evaluation
- Conclusion

- The IDS is tested against both FGSM and PGD attacks
 - ❖ variable perturbation limit, ϵ .
 - ❖ variable mix ratios \rightarrow ratios of benign and adversarial samples in the dataset
- PGD attacks trigger a sharper decline (i.e., over 50%) compared to FGSM (i.e., 30%)
- FGSM causes notable decrease after $\epsilon = 0.5$
- PGD degrades performance immediately and significantly with $\epsilon = 0.1$.

Accuracy vs Mix Ratio and Epsilon (FGSM)

Accuracy vs Mix Ratio and Epsilon (PGD)

Proposed Framework

- Introduction
- Attack Illustration
- Problem Formulation
- Proposed Solution
- Case Study
- Methodology
- Evaluation
- Conclusion

➤ Data Augmentation with GANs:

- ❖ InfoGAN and WGAN leverage original data to produce synthetic samples, augmenting the training dataset for model resilience.

➤ Autoencoder Retraining:

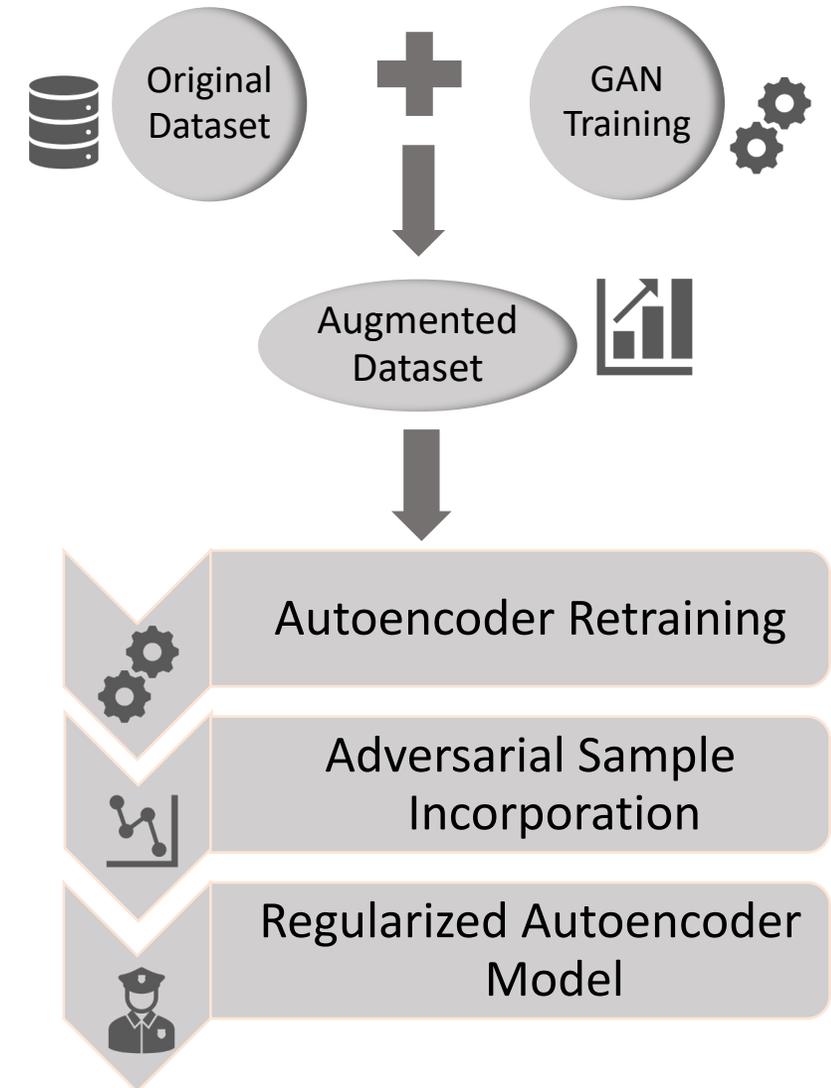

- ❖ The autoencoder is retrained with a mix of original and GAN-generated data to represent weak points in data distribution better.

➤ Adversarial Regularization:

- ❖ Adversarial samples are used as regularizers in training, bolstering the autoencoder's robustness and anomaly detection.

➤ Optimization and Performance Evaluation:

- ❖ The autoencoder's loss now includes a regularization term penalizing adversarial reconstruction. Hence, the model is less sensitive to input manipulations.

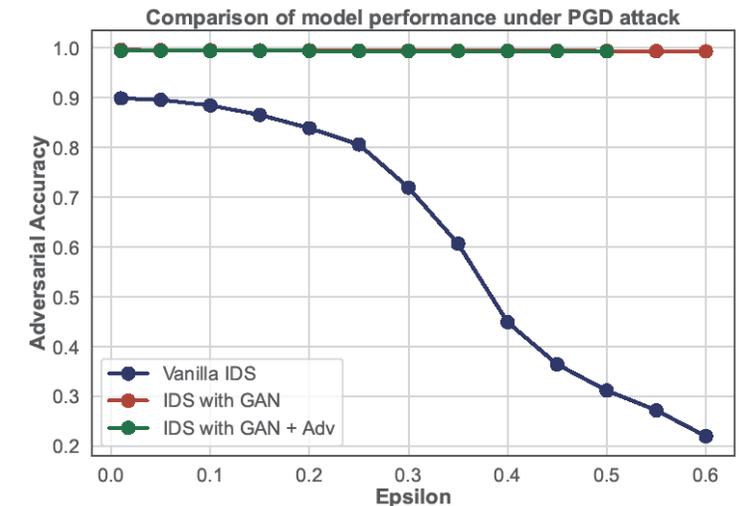

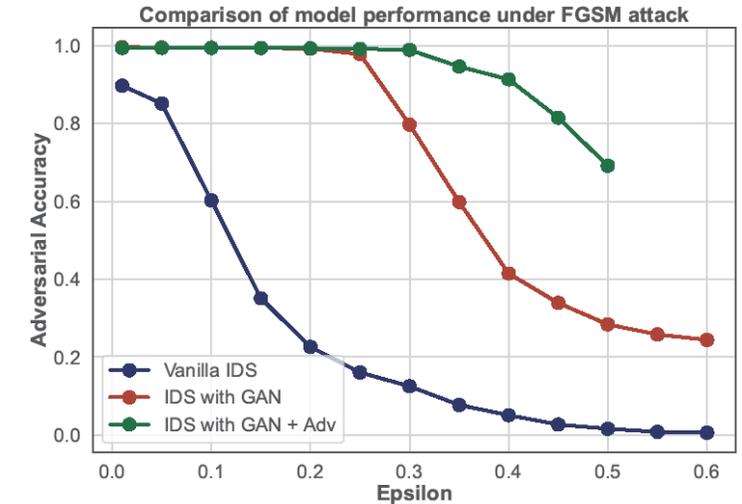

Evaluating Adversarial Attack Defense

- Introduction
- Attack Illustration
- Problem Formulation
- Proposed Solution
- Case Study
- Methodology
- Evaluation
 - RQ1
 - RQ2
 - RQ3
 - RQ4
- Conclusion

- The initial IDS model's adversarial accuracy decreases with higher epsilon values
 - ❖ drops to as low as 0.016042 for FGSM and 0.220658 for PGD attacks
- GAN-augmented IDS shows enhanced resiliency
 - ❖ maintains over 0.99 accuracy for FGSM and PGD attacks at ϵ values up to 0.25
 - ❖ a noted decrease at higher ϵ , particularly for FGSM
- The adversarially regularized IDS remains stable across varying epsilon values
 - ❖ indicates superior resilience provided by adversarial learning

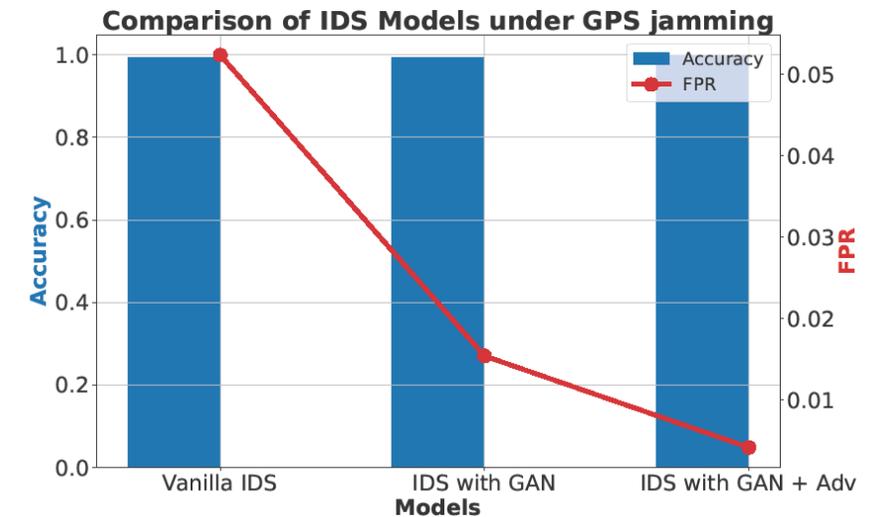

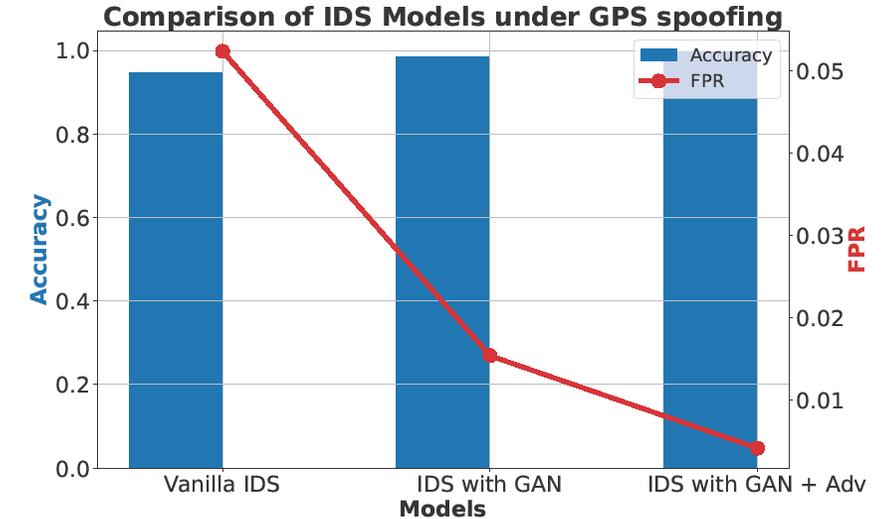

Evaluating Impact on Real GPS Attacks

- Introduction
- Attack Illustration
- Problem Formulation
- Proposed Solution
- Case Study
- Methodology
- Evaluation
 - RQ1
 - RQ2
 - RQ3
 - RQ4
- Conclusion

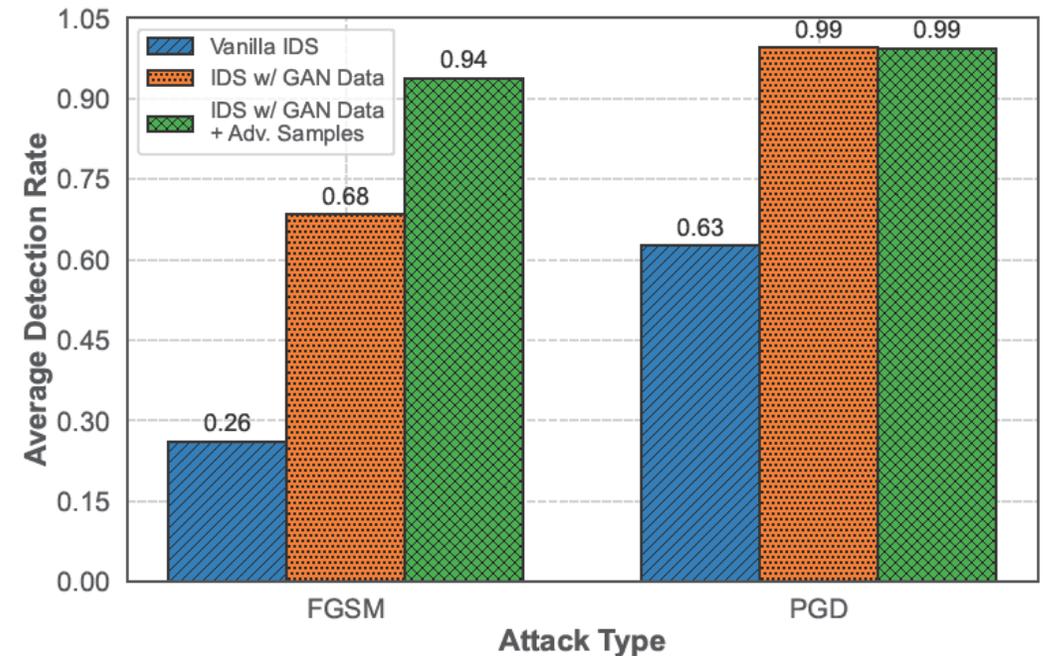

- For GPS spoofing attacks, the original IDS had an accuracy of 0.9476 and an FPR of 0.0523.
- GAN augmentation improved accuracy to 0.9845 and reduced FPR to 0.0154.
- The integration of GAN and adversarial learning in IDS yielded the highest accuracy (0.9957) and the lowest FPR (0.0042).
- In GPS jamming attacks, all models exhibited high accuracies (0.9942 to 0.9977) and low FPRs, with the GAN-augmented and adversarially trained model achieving the lowest FPR of 0.0023.

Evaluating Necessity of the Proposed Sol

- Introduction
- Attack Illustration
- Problem Formulation
- Proposed Solution
- Case Study
- Methodology
- Evaluation**
 - RQ1
 - RQ2
 - RQ3
 - RQ4
- Conclusion

- The original IDS displayed the lowest accuracies against FGSM and PGD attacks.
- GAN data augmentation alone significantly improved IDS accuracy, particularly for PGD attacks.
- Combining GAN data augmentation with adversarial learning resulted in further improvements, especially for FGSM attacks.

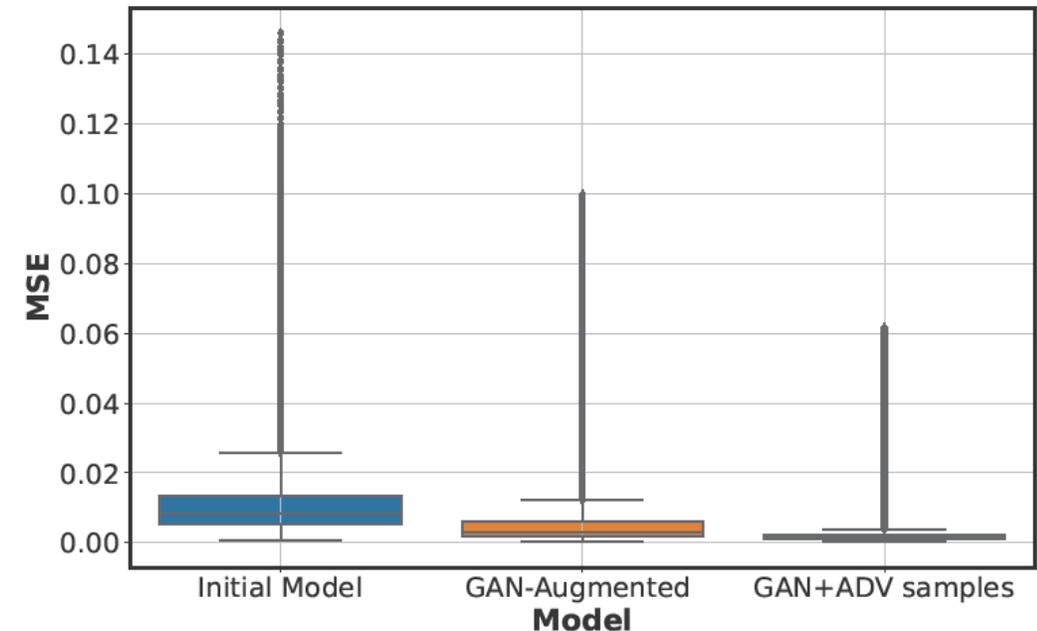

Evaluating IDS Model Performance

- Introduction
- Attack Illustration
- Problem Formulation
- Proposed Solution
- Case Study
- Methodology
- Evaluation
 - RQ1
 - RQ2
 - RQ3
 - RQ4
- Conclusion

- The initial IDS model showed MSE values between 0.008927 and 0.007868, indicating a moderate fit to the data with room for improvement.
- GAN augmentation improved the model's performance, reducing MSE to a range between 0.006594 and 0.002299, suggesting a better fit to the data.
- Combining GAN data augmentation with adversarial samples yielded the lowest MSE values (approximately 0.002309 to 0.002104).

- Introduction
- Attack Illustration
- Problem Formulation
- Proposed Solution
- Case Study
- Methodology
- Evaluation
 - RQ1
 - RQ2
- Conclusion

- In this work, we have highlighted the vulnerabilities of current IDS for UAVs against GPS spoofing and jamming attacks and proposed a framework using GANs and adversarial sample-based regularization.
- Under FGSM and PGD adversarial attacks, the detection rates for our improved IDS are 93.78% and 99.39%, respectively, outperforming the baseline rates of 26.14% and 62.6%.
- Additionally, our resilient IDS demonstrated an accuracy of 99.57% against GPS spoofing, substantially better than the conventional IDS accuracy of 94.76%.
- Importantly, the false positive rate was also reduced to 0.42% compared to the previous 5.23%.
- In future research, we will explore techniques like deep reinforcement learning, and study adaptability to other domains.
