Updated 4 years ago

Firefox hangs during first presentation of hardware client cert

Product: Core ▾

Component: Security: PSM ▾

Platform: x86 Windows XP

Type:  defect

Priority: P3

Reproducible: Always

Steps to Reproduce:

1. Plug Hypothekarbank Lenzburg (HBL) security hardware into USB interface.
2. Launch Firefox
3. Browse to <https://ebanking.hbl.ch>
4. Enter security hardware PIN when requested

Actual Results:

Firefox hangs. Can kill it with X (close), but do virtually nothing else.

Expected Results:

Should ask what certificate I would like to present, and then show me the bank's HTML page.

I have an NSPR_LOG of such a session that I will submit as a next step.
